The Bronze package starts at \$99 per month with the highly integrated Platinum package that costs \$649 per month. KiboKibo helps retailers and brand manufacturers achieve optimal performance B2C and B2B commerce. It offers a complete omnichannel commerce platform delivered with a low total cost of ownership and a fast time-to-market. The price depends on which options you choose, but there is a free demo to try on demand. image: Depositphotos.com About Process Manager Process Manager is a cloud-based workflow management solution for product quality, safety, and compliance. Process Manager includes security and data integrity features needed for FDA compliance, including audit trails, user consent rules, and data encryption. The software helps food, drug, and CPG manufacturers optimize data capture and workflow efficiency on the production floor, while improving real-time operational visibility for managers. Administrators create process templates that staff start and include a list of tasks. Each task is assigned to one or more roles and requires the user to collect data, such as photos or numbers for automated calculations. Employees are informed when their job is due to com... Read more Credit: Paul Tobeck/Shutterstock Unless you work in an area that uses maintenance management software, you are not familiar with what it is or what it does. As a result, many small businesses can't even realize they can benefit from a maintenance management system. Maintenance management software (MMS), also known as enterprise asset management (EAM) and automated (or commercial) maintenance management software (CMMS), helps companies track equipment, vehicles, facilities and more. Its use varies from industry to industry, but it takes a lot of guesswork out of keeping your business up and running. CMMS is flexible enough to be used in a variety of industries including manufacturing, healthcare, education, hospitality and the non-profit sector, said Daniel Golub, business development manager at maintenance management software company HippoFM. Do you think your business might be too small for a maintenance management program? One of the advantages of CMMS solutions, Golub added, is that they are scalable to meet the size and price of your business. Editor's note: Looking for maintenance management software for your company? If you're looking for information to help you choose the one that suits you, use the questionnaire below to get free information from different vendors: If you have multiple assets to track, but you've done it manually from day one, it might be time to switch to maintenance management software. Spreadsheets and paper systems are extremely limited and work primarily to keep track of basic lists of assets, components, etc., says Chris Mumford, content manager maintenance management software company ManagePlus. Ultimately, MMS is all about increasing organization and efficiency – things that are important to all companies. Any company that wants to become more efficient and their assets and the costs of the of these assets can benefit from a CMMS, said Tim Knodel, sales manager at business software company CyberMetrics Corp. In addition to boosting efficiency and organization, maintenance management software offers various business benefits of all sizes. The software can help ensure that your business continues to comply with all industry-specific regulations by providing a solid record of all the work done on your assets. Mumford said. Maintenance management software also saves you time, giving you the opportunity to work on more important things. CMMS frees up daily production and operational tasks, allowing a company to focus on strategic decisions at a higher level and delivering the best product or service to their end user, golub said. And while CMMS solutions have a price, they can ultimately save entrepreneurs a lot of money. Golub said many managers tend to look at this software as a cost and have a difficult time putting a dollar value on its benefits, such as lower labor costs, increased morale due to better processes, and overall transparency of maintenance. But one of the biggest savings entrepreneurs see when using maintenance management software is that their equipment takes longer. By having a preventive maintenance program in place, you need to live more out of your assets, which can result in significant cost savings, said Knodel. Another big advantage? Because MMS tracks your inventory and maintenance costs, you can easily manage your project costs and see where to spend, and more importantly, where you save money. [Maintenance software] can provide important insight into operations that can drive further improvements and initiatives, Mumford said. Of course, some problems may arise when using maintenance management software. Knodel and Golub agreed that problems can arise if companies do not train their staff properly to use the software, especially if employees are not technically savvy. Entrepreneurs should also be very wary of their contract with the software provider, Golub said. Make sure timely software updates are included so you always have the best version of your CMMS. And meet your contract. Some providers charge high upfront costs that you could put over budget or tie you into the long-term agreement with high penalties to get out, Golub said. Switching to maintenance management software also means implementing a whole new system in your company, which can be a different con. For many companies, the transition to a new system means leaving behind an old system. Even if the existing system is inefficient and outdated, there may be some resistance to change, Mumford said. If you think that suitable for your business, make sure you check the available providers and choose one that suits your needs. Golub noted that there are a few steps to choosing the right maintenance software company. Make sure you do your research and pricing models, while you're looking for hidden fees. Golub suggested comparing at least five different providers to make sure you find the right fit. Then receive credentials by reading reviews and reaching existing customers, to discuss how they used the software and measure their satisfaction levels. It is important to ensure that the provider you choose is reliable, customizable and has a solid reputation. The key is to look at companies that have a strong track record of performance, a commitment to continuous innovation, and products and services that can be tailored to your business's unique needs, and that can also grow as your business grows. Mumford said, adding that it is vital to choose a company that is committed to adaptation and improvement, since the change in the technology is constant. Golub also suggested going for a web-based MMS system as opposed to on-premise software. Cloud-based solutions are less risky, he said, and generally have minimal (or zero) upfront costs. They also include regular software updates and take steps to ensure the security and integrity of your data. Ultimately, the key is to make sure that your software meets your needs and is especially user-friendly. In the pursuit of robust software, many companies end up compromising usability, said Golub. There is a high correlation between a non-indicative interface and end-user software resistance. The best solution is that balance between your functional requirements, user friendliness and affordability. Before you buy a CMMS solution, our experts told you to ask yourself these 10 questions: Why does our company need this system? What assets should we keep in the game? What problems are we trying to solve? What features do we need? Does this provider have a proven track record? Is this system user-friendly? Can we adapt this system to our needs? Will this system grow and adapt to our business? Do we have time to commit to implementing this system? Are we willing to train our staff to use it properly? Your answers to these questions, along with your research, should help you make a more informed decision about the role maintenance management software can play in your business, and which software provider, if any, works best for you. When you buy maintenance software, it's important to plan ahead before switching to using it. Data integration and account settings can take a long time, depending on the number of assets you have or the number of users who need permissions, Golub said. To speed up the process, get your data ready. Create a comprehensive Excel spreadsheet with all items you want to keep track, such as components, elements, PM schematics, and users, golub says. The preparation now will get you ahead of the game implementation time. And once your system is set up and in use, you even discover more benefits that you didn't know your business was needed. Many companies buy [maintenance software] with a certain amount of in mind, and then discover other areas where they can improve after they've been using them for a while, mumford said. Editor's note: Looking for maintenance management software for your company? If you're looking for information to help you choose the one that suits you, use the questionnaire below to get free information from different vendors: Originally published on Business News Daily Daily
